Kubernetes

Shreyansh Mishra

Senior Associate Consultant @ Infosys
Gurugram, Haryana, India

Summary

I'm a Senior Associate Consultant at Infosys, specializing in DevSecOps and cloud automation. I design and build secure, scalable CI/CD pipelines using Azure DevOps and Terraform, enabling reliable cloud infrastructure provisioning while reducing manual effort and deployment risk. Much of my work centers on Kubernetes — orchestrating containerized workloads, managing deployments, and building resilient, self-healing infrastructure — alongside Docker, Infrastructure as Code (IaC), and AWS, all with a strong focus on security-by-design. At Infosys, I collaborate with cross-functional teams to implement DevSecOps practices including vulnerability scanning, automated patch management, and secure pipeline integrations. I enjoy solving complex infrastructure challenges and helping teams ship faster without compromising security. Beyond core DevOps, I'm actively exploring the intersection of AI and infrastructure building with agentic AI systems and LLM-powered tooling, and thinking through how to make software AI-native (from cost architecture at scale to human-in-the-loop automation for monitoring and operations). I'm especially interested in where reliable cloud platforms meet intelligent, agent-driven workflows. My core strengths include Kubernetes, Docker, Terraform, cloud networking, and automation. I'm particularly interested in roles that combine container orchestration, DevOps, security engineering, and applied AI.

Experience

Infosys

Senior Associate Consultant

March 2025 - Present (1 year 5 months)

Built and maintained end-to-end CI/CD workflows in Azure DevOps that reduced failed production deployments by ~60% and shortened lead time for changes by ~70% through automated testing and gated releases.

Integrated DevSecOps into pipelines (SAST/DAST/VA + automated patching), surfacing security issues earlier and decreasing security regressions and high-severity findings by ~70% before release.

Managed IaC + configuration orchestration with Terraform and Ansible across Azure and hybrid cloud, achieving >95% environment parity between staging and production and enabling reproducible, auditable deployments.

Engineered observability and alerting using Azure Monitor, Azure Monitor Agent (AMA) and KQL — created actionable dashboards and refined alerts to reduce mean time to detect/repair (MTTD/MTTR) by ~40% and cut noisy alerts by ~50%.

Automated Active Directory (AD) integration for Linux systems (SSSD/realmd/pam + Kerberos) using Ansible and reusable playbooks — reduced Linux user onboarding from days to <1 hour, centralized access control for compliance, and lowered password-related helpdesk tickets by ~70%.

Performed Linux systems engineering & hardening across multiple distros (RHEL, Ubuntu, CentOS) — implemented tuning, automated CIS-based hardening and kernel/security configs to improve stability and achieve 99.9% availability for critical services.

Improved incident outcomes and reliability by instituting runbooks, automated health checks, and post-incident RCA; reduced recurrence of similar incidents by ~60% and shortened incident resolution time by ~45%.

Kyndryl

Automation Engineer

October 2023 - March 2025 (1 year 6 months)

- Developed and maintained Ansible playbooks to streamline system updates (CentOS to RHEL migrations), user account management, and security tool integrations (CrowdStrike, QRadar).
- Automated routine Linux administrative tasks for over 8000+ servers using Ansible, including patch management, pre-checks, and storage snapshots, significantly reducing manual toil.
- Proactively monitored system performance and OS issues using Nagios and Grafana, providing timely resolution for critical production systems.

- Collaborated with cross-functional teams to implement change management in Jira and ensure seamless, automated delivery of infrastructure changes.
- Played a key role in disaster recovery (DR) planning by automating data backup and recovery processes, ensuring business continuity.

Paytm

Software Engineer

January 2021 - October 2023 (2 years 10 months)

- Gained foundational experience in container management, deploying and managing applications with Docker and Kubernetes.
- Troubleshoot complex hardware, software, and network connectivity issues.
- Managed and configured Linux environments (CentOS, Ubuntu, Red Hat) and VMware vSphere infrastructure.
- Installed, configured, and maintained VMware High Availability (HA) and Virtual SAN (vSAN) solutions.
- Administered user accounts, groups, and permissions, and implemented data backup and recovery systems.

Education

Manipal University Jaipur

Bachelor of Technology, Computer Engineering · (August 2016 - November 2020)
